CodeAlpha Internship Submission Guide

GitHub upload instructions + video presentation scripts for Tasks 1, 2, and 3

Beginner-friendly guide

Task 1: Iris Flower Classification
Task 2: Unemployment Analysis with Python
Task 3: Car Price Prediction

Use this guide with the matching notebooks and project PDFs. Your internship instructions take priority if they specify a different repository name or submission process.

Part A — Upload a project to GitHub (website method)

1. Sign in

Open github.com and sign in. If you do not have an account, create one.

2. Create a repository

Click the + icon near the top-right, then choose **New repository**.

3. Enter the repository name

Use the format required by your internship. Suggested names:
CodeAlpha_IrisFlowerClassification
CodeAlpha_UnemploymentAnalysis
CodeAlpha_CarPricePrediction

4. Choose visibility

Choose Public only if your internship allows public repositories and your files contain no private information. Otherwise choose Private.

5. Add a README

Tick **Add a README file**. A README explains what the project does and how to run it.

6. Create the repository

Click **Create repository**.

7. Upload your project files

Inside the repository, choose **Add file** → **Upload files**. Drag in the relevant notebook (.ipynb), README.md, and requirements.txt. Add the matching PDF guide if you want it included.

8. Commit the files

Scroll down, type a short message such as *Upload project notebook and documentation*, then click **Commit changes**.

9. Check the repository

Open the repository page and confirm the files are visible and the notebook opens. Copy the repository URL for your submission form.

10. Repeat for each task

Create a separate repository for each project if that is what your internship instructions require. Use the exact names requested by the CodeAlpha instructions if they specify a naming format.

Recommended files for each repository

File	Why include it?
Project notebook (.ipynb)	Contains the code, outputs, charts, and explanations.
README.md	Explains the project and how to run it.
requirements.txt	Lists Python libraries needed to run the project.
PDF guide (optional)	Helpful documentation, if allowed by your internship.
Screenshots (optional)	Shows charts or results; do not use screenshots instead of source code.

Important: Do not upload passwords, API keys, private datasets, or files you are not allowed to share. Confirm the dataset's usage terms before redistributing it.

Part B — README template

```
# Project Title

## Overview
Briefly explain what the project does and why it is useful.

## Objective
State the question you are trying to answer or predict.

## Dataset
Mention where the dataset came from and describe the important columns.

## Tools and Libraries
Python, pandas, NumPy, Matplotlib, Seaborn, scikit-learn (list only those actually used).

## Steps
1. Load the data.
2. Inspect and clean the data.
3. Explore the data with charts.
4. Build the model or analysis.
5. Evaluate results and explain limitations.

## How to Run
Open the notebook in Jupyter or Google Colab and run the cells from top to bottom.

## Results
Add your real results after you run the notebook. Do not invent scores.

## Limitations and Future Improvements
Explain what could be improved and what the project cannot prove.
```

Part C — Video presentation tips

Recommended length

Aim for about 2–4 minutes per project unless your internship specifies another duration.

Before recording

Run the notebook from top to bottom. Close unrelated tabs. Make sure your charts and real model results are visible. Do not read every line of code.

Simple video structure

1) Introduce yourself and project. 2) State the goal. 3) Show the dataset. 4) Explain the key steps. 5) Show charts/results. 6) Mention one limitation and one improvement. 7) Show the GitHub repository link.

Speak naturally

You can read the sample scripts below, but change any details to match the results you actually got.

After recording

Post the video on LinkedIn according to your internship instructions, include the correct GitHub repository link, and submit the required form. Do not expose personal details or private files in the recording.

Task 1 — Iris Flower Classification

What to show on screen: notebook title, dataset sample, flower measurements, model training cell, evaluation result, and one prediction.

> Hello, my name is [your name]. This is my CodeAlpha Task 1 project, Iris Flower Classification. The goal is to predict the type of iris flower from measurements such as sepal length, sepal width, petal length, and petal width. I used Python and scikit-learn. First, I loaded and explored the dataset. Then I split the data into training and testing sets and trained a classification model. I evaluated the model using the results shown in my notebook. I also tested a prediction. This project helped me understand classification, train-test splitting, and model evaluation. One improvement would be to compare more algorithms and use cross-validation. The source code and notebook are available in my GitHub repository: [paste repository link]. Thank you.

Task 1 checks

• Use the actual model name from your notebook.

• Mention your actual evaluation score only after running the notebook.

• Do not claim perfect accuracy unless your measured result supports it.

Task 2 — Unemployment Analysis with Python

What to show on screen: dataset columns and date range, missing-value checks, unemployment trend chart, any comparison chart, and your findings.

> Hello, my name is [your name]. This is my CodeAlpha Task 2 project, Unemployment Analysis with Python. The purpose is to explore unemployment data and understand how the values change over time and across available groups or regions. I used Python with pandas for data handling and Matplotlib or Seaborn for visualization. I loaded the data, checked the columns and missing values, cleaned the data where needed, and created charts to explore trends. The charts help describe patterns in the dataset, but they do not prove that one event caused a change in

unemployment. A future improvement would be to use a verified, well-documented data source and add more careful comparisons. The code and notebook are available here: [paste repository link]. Thank you.

Task 2 checks

- Confirm the data source and date range before recording.
- Only describe trends that your charts actually show.
- Do not say a factor caused unemployment to rise or fall unless your analysis can support that claim.

Task 3 — Car Price Prediction

What to show on screen: data preview, cleaning, price charts, train/test split, Random Forest training, MAE/RMSE/R^2, sample prediction, and saved model.

> Hello, my name is [your name]. This is my CodeAlpha Task 3 project, Car Price Prediction. The goal is to estimate the selling price of a used car using details such as its year, kilometers driven, fuel type, and transmission, depending on the columns available in the dataset. I used Python, pandas, visualization libraries, and scikit-learn. I inspected and cleaned the data, created charts, split the data into training and test sets, and trained a Random Forest regression model. I evaluated it using Mean Absolute Error, Root Mean Squared Error, and R-squared. These values are shown in my notebook and should be interpreted in the dataset's price units. The prediction is only an estimate, because real prices also depend on condition, location, service history, and market timing. A future improvement would be to test more models and use a larger, newer dataset. My code is available at [paste repository link]. Thank you.

Task 3 checks

• Run the notebook first and quote your real MAE, RMSE, and R^2 if you choose to mention them.

• Explain that the predicted price uses the same units as the target column.

• Do not describe the estimate as a guaranteed market price.

Part D — Final submission checklist

■ Each project has its own correct repository, if required.

■ The notebook is uploaded and opens on GitHub.

■ README explains the objective, dataset, steps, results, and limitations.

■ Any results or accuracy/metric values are real and came from running the notebook.

■ The video shows the project working, not only slides.

■ The LinkedIn post contains the correct repository link.

■ The internship submission form is completed.

■ No private data, passwords, or secrets are exposed.
